

Tropaeolum (Nasturtium)

Sowing

- You can start the seeds indoors direct in the final container or directly outdoor.
- Sow at 18-21°C in moist soil at 1 cm deep. Do not allow to dry. It will germ in 10-14 days.
- Nasturtiums prefer poorer soils and they do not need fertilizers (unless your soil is extremely poor). Fertile soil will produce fewer blooms.

Care

- Water regularly throughout the growing season, but be careful not to over-water your plants.
- Cutting off the faded/dead flowers will prolong blooming.
- If you're growing nasturtiums in containers, they may need to be trimmed back occasionally over the growing season.

Crop schedule

Container size	Pack	10 cm pot	25 cm pot
Number of weeks	7-8	8-9	10-11

Can vary depending of the varieties
