**Type** Ever bearing variety, compact but vigorous, producing cascades of flowers with few runners.

**Appearance** Red flower with a yellow center, green foliage and large conical fruits.

**Plant Cultivation** For best results, sow inside under glass or plastic and keep moist. Lightly cover the seeds with vermiculite. After complete lifting, maintain the young plants at a cool temperature (night temperature 10 °C). The transplant can then be done in cold layers or under unheated plastic tunnel. Requires a lot of light.

**Watering** The strawberry plant must be watered regularly but in a limited manner, especially during summer heat. In summer, favor watering at night or early mornings which will avoid quick water evaporation under the sun.
