

Strawberry Hyb. Toscana: Fleuroselect winner. Toscana will bear flowers and fruits the first year.

Sowing months ***	Germination ***	Temperature ****	Flowering ***	Maturity ***
January - March	21 - 28 days	18 °C	Mai - first frost	70 days

Height ***	Spreading ***	Exposure ****	Harvest ****	Hardiness zone ***
25-30 cm	20 cm	sun	June - September	4

Type Ever bearing variety, with good resistance to frost. It can produce runners up to 1 m long.

Aspect Vivid pink flower of 5 cm, green foliage and large conical red fruits.

Plant Cultivation For best results, sow inside under glass or plastic and keep moist. Lightly cover the seeds with vermiculite. After complete lifting, maintain the young plants at a cool temperature (night temperature 10 °C). The transplant can then be done in cold layers or under unheated plastic tunnel. Requires a lot of light.

Watering The strawberry plant must be watered regularly but in a limited manner, especially during summer heat. In summer, favor watering at night or early mornings which will avoid quick water evaporation under the sun.
